The skeletal system is composed of bones and cartilage connected by ligaments to form a framework for the rest of the body tissues. There are two parts to the skeleton: Axial skeleton – bones along the axis of the body, including the skull, vertebral column and ribcage;

Skeletal system 1: the anatomy and physiology of bones ...

The skeletal system includes all of the bones, cartilages, and ligaments of the body that support and give shape to the body and body structures. The skeleton consists of the bones of the body. For adults, there are 206 bones in the skeleton.

Indeed humans are fortunate to have the entire skeletal system because it fulfills many important functions in the body. The skeletal system protects the soft tissues and vital organs; enables easier locomotion and serves as a framework as it shapes and supports the entire body.
