The terms " automatic " and " manual wind " refer to how the power is transferred to the mainspring in the first place. How this happens in a manual wind is pretty obvious. You turn the crown, which in turn winds up the mainspring, and, using a ratchet, the spring is kept wound and prevented from unwinding, except by transferring power to the escapement.

Automatic vs Hand Wound - anOrdain

Manual wind watches are not self-winding like an automatic watch and therefore require that you wind them by hand or sometimes with a special tool in order for the watch to operate. Similar to the manual transmission where you need to be more hands-on to use it.

Manual Wind Watches VS Automatic Watches | Which is Best?

Manual winding is not required. How Automatic Movement Works. The internal mechanism is similar to a mechanical movement. A metal weight called a rotor is added to the manual parts. The rotor can rotate freely and is connected to the movement. The rotor spins with each movement of the wrist, transferring the energy to the mainspring.
