Binary adaptive optics involves using a simple two-state algorithm for wavefront correction. The technique lends itself to implementation using ferroelectric liquid crystal spatial light modulators (FLC-SLMs) as half-wave and quarter-wave phase shifters.

Recently CHARA has started using the Mount Wilson Institute Adaptive Optics system (MWI-AO) to complement its standard speckle program of binary star astrometry. The main goal of the adaptive optics program is to determine magnitudes of each individual component of these binaries, which will yield spectral types. The eventual aim is to combine the astrometric and photometric information, in ...
