While other diesel injection systems generate the fuel pressure for each injection separately, the Common Rail System separates pressure generation and injection from one another. The fuel is constantly available at the pressure required for injection. The Common Rail System is modular in design. The right combination of high-pressure pump, injectors, rail and electronic control unit results in systems for

The high-pressure pump CP4 delivers the fuel into the connected rail under high pressure. The CP4 consists of one or two high-pressure elements, each integrated in a housing with its own camshaft. The pump camshaft is driven by belts, chains, or cogwheels and moves the pump pistons to generate the required high pressure.

There is a lot of movement - also in a figurative sense - when it comes to the diesel engine and diesel-fuel injection, in particular. These developments are now described in the completely revised and updated 3rd Edition of the Diesel-Engine Management reference book. The electronics that control the diesel engine are explained in easy detail. It provides a comprehensive description of all conventional diesel fuel-injection systems. It also contains a competent and detailed introduction to the modern common rail system, Unit Injector System (UIS) and Unit Pump System (UPS), including the radial-piston distributor injection pump.
