Pharmacology in Clinical Practice describes basic pharmacology, clinical pharmacology, including the pharmacology of important drug groups. The author reviews the general principles of clinical pharmacology including drug actions, absorption, disposition, and excretion. Most drugs are xenobiotics—compounds foreign and harmful to human living tissues. Drugs should be properly metabolized and converted to nontoxic substance before being excreted either through spontaneous changes not mediated by enzymes or through transformation by enzyme systems. The author also discusses pharmacokinetics, including drug plasma concentration, absorption, first-pass metabolism, distribution and elimination. The author addresses pharmacogenetics that deal with possible different responses to drug intake due to factors such as age, sex, liver or renal disease, smoking, diet. The book tackles other drugs, their uses, and characteristics such as antibacterial agents, obesity drug, cytotoxic drugs or those used in chemotherapy medicine. The author explains the diagnosis of drug ingestion, clinical signs of overdose, clinical course, and prophylactic measures for users to avoid drug overdose or self-poisoning. This book is intended for medical undergraduates, pharmaceutical technicians, pharmacists, students or professors in pharmacology or general medicine.

For the second edition new authors, superb new illustrations and a second colour have all been introduced. With its unique approach combining a thorough understanding of the pharmacological action of drugs with a basic understanding of the relevant physiology and pathophysiology of systems and tissues affected, Small Animal Clinical Pharmacology continues to be an indispensable book for all veterinary students and practitioners. Organised by drug class in a uniform and detailed structure which means it is easy to locate key information on dose rates, routes of administration, drug interactions and special considerations at a glance. Key chapters based around treatment of disorders of particular body systems, eg cardiovascular and thyroid disorders. Essential introductory chapters covering pharmacokinetics, general pharmacological principles and adverse reactions for a thorough basic grounding in the subject. All authors are experienced clinicians and recognised experts in their field who bring a down to earth and practical approach to the text.

Presented in a highly visual style, this book offers an introduction to clinically relevant pharmacologic agents used in small and large animal practice. It includes an overview of key concepts in pharmacology including basic principles of pharmacodynamics, physiological uptake and nervous system perception. Various types of drugs are discussed, including: tranquilizers, sedatives and opioids. Pharmacologic effects, side effects, drug interactions and species differences are illustrated with emphasis on figures, charts and diagrams. Diabetes continues to spread worldwide. Traditionally diabetes in adults has not been considered a serious life-threatening disease. This attitude needs to be changed, however, since the complications associated with the adult form of diabetes affect almost every organ system. The high morbidity and mortality of Non-Insulin-Dependent Diabetes Mellitus (NIDDM) suggest that current treatment strategies are unsatisfactory, pointing to an urgent need for new therapeutic approaches. This volume provides a comprehensive description and evaluation of recently obtained and previously unpublished data written by leading experts in the field, together with a discussion of antidiabetics under development and new approaches for the management of type 2 diabetes.

The Actions and Uses of Ophthalmic Drugs, Third Edition discusses the application and discrimination in the use of ophthalmic drugs. The book reviews the general pharmacological principles including drug nomenclature, pharmacological classification, pharmacokinetics, pharmacodynamics, and the use of these drugs. Ophthalmic drugs (cycloplegics, mydriatics, miotics) directly or indirectly, stimulate or inhibit a part of the autonomic nervous system connected to the intra-ocular muscles. The text investigates in detail the structure and function of this involuntary nervous system in the orbital region as it is affected by these drugs. The book explains the different drug classifications, their therapeutic and diagnostic purposes, including the ideal properties, indications, contra-indications, mode of action, or adverse effects of cycloplegics, of mydriatics, and of miotics. The book also describes the uses and characteristics of local anesthetics, stains, anti-infective agents, and miscellaneous agents (antihistamines, vasoconstrictors).
