"Human beings have forgotten their instructions" That is how many of the Native elders responded to Manitonquat when he traveled the continent over forty years ago seeking answers to the questions "What is wrong with people? Why is there war, violence, oppression, greed, injustice, poverty, indifference and destruction of the environment?" Sitting with and listening to many elders of First Nations from all parts of North America, he began to form a clearer idea of what they often called "the Original Instructions". All of Creation is formed by them - what some refer to as Natural Law, Dharma, or Tao. Those instructions for successful and happy relationships with families and communities and with all life, the Earth and the Cosmos, were passed down through the generations by elders of the indigenous peoples, who lived successfully and happily by them until they were invaded by newer cultures of domination, oppression and greed. These elders are becoming more rare as fewer and fewer young people have access to their wisdom and more and more follow the destructive ways of the dominant culture in materialism and self-centeredness. Manitonquat, a Wampanoag elder now in his 80th year, is a direct link to the old ways of the people. In a culture of domination there is more violence, more fear, more isolation, and less love and happiness than in the old ways of all people at one time, ways of cooperation and equality, of respect and relatedness and thanksgiving. Manitonquat was told by the elders that since he had been taught the skills of communication in the university he was meant to bring their teachings to the world (as they said they were not Indian but Human Being teachings), to any who sought and wished for that knowledge. Doing that in books and talks all over the world, he has acquired added insight into the problems of society today and a unique perspective in bringing circles to many prisons weekly for the past 25 years.

Grid-Scale Energy Storage Systems and Applications provides a timely introduction to state-of-the-art technologies and important demonstration projects in this rapidly developing field. Written with a view to real-world applications, the authors describe storage technologies and then cover operation and control, system integration and battery management, and other topics important in the design of these storage systems. The rapidly-developing area of electrochemical energy storage technology and its implementation in the power grid is covered in particular detail. Examples of Chinese pilot projects in new energy grids and micro grids are also included. Drawing on significant Chinese results in this area, but also including data from abroad, this will be a valuable reference on the development of grid-scale energy storage for engineers and scientists in power and energy transmission and researchers in academia. Addresses not only the available energy storage technologies, but also topics significant for storage system designers, such as technology management, operation and control, system integration and economic assessment. Draws on the wealth of Chinese research into energy storage and describes important Chinese energy storage demonstration projects Provides practical examples of the application of energy storage technologies that can be used by engineers as references when designing new systems

This book presents the papers from the Internal Combustion Engines: Performance, fuel economy and emissions held in London, UK. This popular international conference from the Institution of Mechanical Engineers provides a forum for IC engine experts looking closely at developments for personal transport applications, though many of the drivers of change apply to light and heavy duty, on and off highway, transport and other sectors. These are exciting times to be working in the IC engine field. With the move towards downsizing, advances in FIE and alternative fuels, new engine architectures and the introduction of Euro 6 in 2014, there are plenty of challenges. The aim remains to reduce both CO2 emissions and the dependence on oil-derivate fossil fuels whilst meeting the future, more stringent constraints on gaseous and particulate material emissions as set by EU, North American and Japanese regulations. How will technology developments enhance performance and shape the next generation of designs? The book introduces compression and internal combustion engines' applications, followed by chapters on the challenges faced by alternative fuels and fuel delivery. The remaining chapters explore current improvements in combustion, pollution prevention strategies and data comparisons, presents the latest requirements and challenges for personal transport applications gives an insight into the technical advances and research going on in the IC Engines field provides the latest developments in compression and spark ignition engines for light and heavy-duty applications, automotive and other markets
