Cardiac arrest can strike a seemingly healthy individual of any age, race, ethnicity, or gender at any time in any location, often without warning. Cardiac arrest is the third leading cause of death in the United States, following cancer and heart disease. Four out of five cardiac arrests occur in the home, and more than 90 percent of individuals with cardiac arrest die before reaching the hospital. First and foremost, cardiac arrest treatment is a community issue - local resources and personnel must provide appropriate, high-quality care to save the life of a community member. Time between onset of arrest and provision of care is fundamental, and shortening this time is one of the best ways to reduce the risk of death and disability from cardiac arrest. Specific actions can be implemented now to decrease this time, and recent advances in science could lead to new discoveries in the causes of, and treatments for, cardiac arrest. However, specific barriers must first be addressed. Strategies to Improve Cardiac Arrest Survival examines the complete system of response to cardiac

arrest in the United States and identifies opportunities within existing and new treatments, strategies, and research that promise to improve the survival and recovery of patients. The recommendations of Strategies to Improve Cardiac Arrest Survival provide high-priority actions to advance the field as a whole. This report will help citizens, government agencies, and private industry to improve health outcomes from sudden cardiac arrest across the United States.

Medical errors occur in hospitals throughout the United States (US). These errors result in more than one million injuries and nearly 98,000 deaths annually. The Institute of Medicine report, "To Err is Human", highlighted the US healthcare system's failure to do enough to prevent mistakes. Hence, patient safety has become a focal issue. One safety strategy implemented to rescue patients was Rapid Response Systems (RRS). The purpose of this study was to determine whether patient characteristics and RRS interventions could predict the patient outcome of an in-hospital cardiac arrest (IHCA). This observational descriptive study: (a) examined instances in which RRS were activated when triggers (the afferent arm of RRS) were detected for patients in a pre-arrest phase of resuscitation, and (b) reviewed interventions undertaken during the medical emergency team (MET) event (the efferent arm of RRS). Data from the American Heart Association's "Get with the Guidelines®—Resuscitation" (GWTG®-R) database were used to answer research questions about patient characteristics and RRS interventions associated with IHCA. Binary logistic regression (LR) was conducted to analyze GWTG®-R data that spanned ten years (2005-2015). Data were from 401,651 cases from over 700 hospitals. Using Statistical Program for the Social Sciences (SPSS) software LR resulted with three models, but the effect sizes were small (0.06 to 0.17). The predictor variables with a high probability for IHCA included: Triggers — (a) respiratory, (b) neurologic, (c) medical, and (d) unknown; (e) black race; (f) surgical-cardiac illnesses; (g) 250 to 499 bed hospitals; (h) cardiac drug(s); (i) non-invasive ventilation; (j) invasive ventilation; (k) continuous ECG monitoring; and (l) expert consultations. The study adds knowledge and offers nurses direction as practicing nurses, educators, and researchers to improve patient safety through focus on preventing failure to rescue by using RRS. RRS within GWTG®-R hospitals achieved their purpose to reduce the incidence of IHCA, since only 1% (3,497) of patients who had RRS activated, had IHCA.

In this issue of Critical Care Nursing Clinics, Guest Editor Justin Dilibero brings his considerable expertise to the topic of resuscitation. Top experts in the field cover key topics such as trauma, sepsis, burns, pediatrics, cardiac arrest, and more. Provides in-depth, clinical reviews on resuscitation for critical care nurses, providing actionable insights for clinical practice. Presents the latest information on this timely, focused topic under the leadership of experienced editors in the field; Authors synthesize and distill the latest research and practice guidelines to create these timely topic-based reviews. Contains 12 relevant, practice-oriented topics including improving resuscitation outcomes in severe traumatic brain injury; targeted temperature management after cardiac arrest; family presence and support during resuscitation; the role of the tele-ICU; and more.

There are growing questions regarding the safety, quality, risk management, and costs of PCC teams, their training and preparedness, and their implications on the welfare of patients and families. This innovative book, authored by an international authorship, will highlight the best practices in improving survival while paving a roadmap for the expected changes in the next 10 years as healthcare undergoes major transformation and reform. An invited group of experts in the field will participate in this project to provide the timeliest and informative approaches to how to deal with this global health challenge. The book will be indispensable to all who treat pediatric cardiac disease and will provide important information about managing the risk of patients with pediatric and congenital cardiac disease in the three domains of: the analysis of outcomes, the improvement of quality, and the safety of patients.

Still the #1 resource for today's pediatric ICU teams, Pediatric Critical Care, 5th Edition covers the entire field, from basic science to cutting-edge clinical applications. Drs. Bradley P. Fuhrman and Jerry J. Zimmerman, accompanied by an expert team of editors and contributors from around the world, bring you today's best information on the current and future landscape of pediatric critical care so you can consistently deliver optimum care to your young patients. Boasts highly readable, concise chapters with hundreds of useful photos, diagrams, algorithms, and clinical pearls. Clear, logical, organ-system approach allows you to focus on the development, function, and treatment of a wide range of disease entities. Includes new content on the expanding use of ultrasound at the bedside and the increase in nursing responsibilities in the PICU. Eighteen new chapters cover topics such as delirium, metabolism, endocrinology, nutrition, nursing, and much more. Features expanded and updated information on critical communication, professionalism, long-term outcomes, palliative care, ultrasonography, PCCM in resource-limited settings, ventilator-induced lung injury, non-invasive ventilation, updated CNS pathophysiology, the 'Erythron', and immunity and infection.

Brunner & Suddarth's Textbook of Medical-Surgical Nursing (Single Volume), 15th Edition Keeping tomorrow's nurses at the forefront of today's changing healthcare environment, Brunner & Suddarth's Textbook of Medical-Surgical Nursing, 15th Edition delivers the most comprehensive resource available for nursing students in the medical-surgical course. This bestselling text is designed for the way students like to learn, combining a highly readable approach with engaging case studies and learning tools to help students explore essential patient care practices in real-world terms and gain a more practical understanding of how they'll apply what they've learned in practice. Trusted by instructors, students, and practicing nurses for nearly 60 years, this landmark resource has been comprehensively updated for the 15th Edition to reflect the latest research, evidence-based practices, settings, issues, ethical challenges, and concerns of today's healthcare practice. Complete integration with Lippincott® CoursePoint+ allows you to easily map out your entire course, provide personalized student remediation, and simulate real-world nursing scenarios involving patients mentioned in vignettes in the text, giving your students unparalleled preparation for success in the medical-surgical nursing workforce. Also Available as a two-volume set (978-1-9751-6828-5) Ensure a mastery of essential nursing skills and equip students for success throughout the nursing education continuum with the complete Brunner & Suddarth's Textbook of Medical-Surgical Nursing, 15th Edition solution (available for separate purchase): Lippincott® CoursePoint+ for Brunner & Suddarth's Textbook of Medical-Surgical Nursing, 15th Edition Study Guide for Brunner & Suddarth's Textbook of Medical-Surgical Nursing, 15th Edition vSim for Nursing | Medical-Surgical Lippincott® DocuCare

This book guides emergency healthcare practitioners in the approach and treatment of emergency cases, both adult and paediatric. It also provides the reader with up-to-date knowledge and experience from leaders in various emergency medicine fields, including trauma, toxicology and resuscitation.

In the highly specialized field of caring for children in the PICU, Fuhrman and Zimmerman's Pediatric Critical Care is the definitive reference for all members of the pediatric intensive care team. Drs. Jerry J. Zimmerman and Alexandre T. Rotta, along with an expert team of editors and contributors from around the world, have carefully updated the 6th Edition of this highly regarded text to bring you the most authoritative and useful information on today's pediatric critical care—everything from basic science to clinical applications. Contains highly readable, concise chapters with hundreds of useful photos, diagrams, algorithms, and clinical pearls. Uses a clear, logical, organ-system approach that allows you to focus on the development, function, and treatment of a wide range of disease entities. Features more international authors and expanded coverage of global topics including pandemics, sepsis treatment in underserved communities, specific global health concerns by region. Covers current trends in sepsis-related mortality and acute care after sepsis, as well as new device applications for pediatric patients.
