About 8 million U.S. healthcare workers are potentially exposed to hazardous drugs. Inhalation and skin contact or absorption are the most likely routes of exposure. However, unintentional ingestion from hand to mouth contact and unintentional injection through a needle-stick or sharps injury are also possible.

Hazardous Drugs USP 800 for EVS Training USP General Chapter <800> provides standards for safe handling of hazardous drugs to minimize the risk of exposure to healthcare personnel, patients and the environment. This course will provide an overview of Hazardous Drugs awareness in the healthcare setting.

Hazardous Drugs USP 800 for EVS Training | Risk & Safety ...

The draft Managing Hazardous Drug Exposures: Information for Healthcare Settings, which is in the docket for this activity, is intended to assist employers in establishing their own hazardous drugs management procedures specific to their workplace.

Problem: Safety concerns have existed for more than 40 years about how hazardous drug (HD) exposure contributes to long- and short-term adverse health outcomes for healthcare workers (HCWs). Careless handling may cause toxic residues to infiltrate hospital environments and patient care areas, and can even be traced to patients' homes. New government regulations will require healthcare organizations to minimize exposure risks to HCWs by fully implementing the U.S. Pharmacopeia (USP) Convention Chapter 800: Hazardous Drugs: Handling in Healthcare Settings (USP, 2016) on December 1, 2019. According to Polovich and Olsen (2017), "The implementation of the USP 800 Standards will

represent an important step forward for nurses and other potentially exposed HCWs".

Context:The proposed Doctor of Nursing Practice (DNP) project will implement an HD safe-handling personal protective equipment (PPE) toolkit at an ambulatory cancer infusion center to improve nurses' adherence with the USP 800 Standards and hospital policies addressing PPE use when handling, administering, and disposing of HD. Proposed

Interventions: Interventions for this project will consist of (a) an HD safe-handling PPE toolkit for infusion nurses, (b) a PPE observation tool, (c) an expert panel discussion, (d) a nurses' skills session, (e) safe-handling adherence between observation and self-assessment survey, (f) hazardous drug administration safe handling peer-to-peer checklist, and (g) a performance dashboard to display progress. **Proposed Outcome Measures:** Outcome measures include (a) 90% or higher compliance rates with PPE use and (b) sustained adherence to USP 800 Standards and hospital policies for safe HD handling to 100% by February 2020.

Problem: The U.S. Pharmacopeia (USP, 2016) Convention Chapter 800: Hazardous Drugs: Handling in Healthcare Settings took effect on December 1, 2019. According to Polovich and Olsen (2017), " The implementation of the USP 800 Standards. will represent an important step forward to protect nurses and other potentially exposed healthcare workers (HCWs): (p.1). **Context:** The Doctor of Nursing Practice (DNP) project implemented a hazardous drug (HD) safe-handling personal protective equipment (PPE) toolkit in accordance to USP 800standards and hospital policies at an ambulatory cancer infusion center to improve nurses' adherence with PPE use. **Interventions:** The project consisted of (a) a safe-handling

PPE toolkit, (b) a PPE observation tool, (c) an expert panel discussion, (d) a nurses' skills session, (e) an online safe-handling survey, (f) an HD safe-handling checklist, and (g) a performance dashboard. Measures: Outcome measures included a (a) 90% or higher compliance rate with PPE use during hazardous drug administration and (b) sustained adherence to USP 800 standards and hospital policies by February 1, 2020. Results: A 90% compliance rate for PPE use during hazardous drug administration was achieved by February 1, 2020. Sustainability is at risk due to the COVID-19 pandemic and global PPE shortages, however, nurses were able to adapt to new processes to conserve vital resources and will be reassessed in six months. Conclusions: A systems-thinking approach to the implementation of USP800 was successful in improving compliance and adherence to PPE use among ambulatory care infusion nurses.

The Chapter Answer Book will provide a balance of both formal requirements of the USP chapter as well as practical advice and consideration in complying with the chapter. The reader will be able to follow a nonsterile product from receipt to preparation in a healthcare facility, addressing core elements of the USP chapter. The standards outlined in this chapter include: Facility design specification Personnel training and core competencies Suggested approaches for documenting competency Work practices to meet requirements and best practices Guidelines, procedures, and compliance requirements for compounding nonsterile preparations Compounding quality nonsterile preparations Beyond use dating guidance and training And much more... Author Patricia Kienle is a known authority on sterile compounding. She currently serves as a member of the USP Compounding Expert

Committee and was Chair of the subcommittee and Expert Panel that developed USP as a guide for practical advice and explanation to help ensure compliance with the requirements of USP .

Provides you with the guidelines and techniques you need to safely handle hazardous materials in your workplace. Includes updated tables and figures.

"Modern society is fortunate to have powerful treatments available for a wide range of medical conditions. However, some useful medications can also have serious side effects. When using these drugs for medical treatment, doctors carefully control the dose and monitor the patient to minimize harmful consequences. But the doctors, nurses, pharmacists, and other healthcare workers who handle these medications are also being exposed and may also demonstrate adverse health effects. Hazardous drugs include drugs used for chemotherapy, antiviral drugs, hormones, and some immunosuppressant drugs - all of which may have damaging effects on the body. When these drugs must be prepared and administered, there are workplace best practices that can minimize potentially harmful exposure. These include the use of engineering controls such as biological safety cabinets, closed system transfer devices, needleless systems, and personal protective equipment such as gloves, masks, and gowns. In order to use this equipment appropriately and effectively, healthcare workers need to know which drugs pose a hazard. Starting in 2000, the National Institute for Occupational Safety and Health (NIOSH) began working with multiple partners and stakeholders to address the issue of occupational exposure to hazardous drugs. The

"Veterinary healthcare employees working where hazardous drugs are handled may face health risks. Many of these workers treat small companion animals (primarily cats and dogs), but also larger animals such as horses, with antineoplastic and other drugs that may be hazardous to humans. NIOSH recommends establishing a program to provide appropriate protective measures for veterinary healthcare workers exposed to hazardous drugs." - NIOSHTIC-2
