Animal husbandry is a branch of agriculture concerned with the domestication of, care for, and breeding of animals such as dogs, cattle, horses, sheep, goats, pigs, and other like creatures. Animal husbandry began in the so-called Neolithic Revolution around 10,000 years ago but may have begun much earlier.

Animal breeding is a branch of animal science that addresses the evaluation of the genetic value of livestock. Selecting for breeding animals with superior EBV in growth rate, egg, meat, milk, or wool production, or with other desirable traits has revolutionized livestock production throughout the entire world. The scientific theory of animal breeding incorporates population genetics, quantitative genetics, statistics, and recently molecular genetics and is based on the pioneering work of Sewall

Plant breeding started with sedentary agriculture, particularly the domestication of the first agricultural plants, a practice which is estimated to date back 9,000 to 11,000 years. Initially, early human farmers selected food plants with particular desirable characteristics and used these as a seed source for subsequent generations, resulting in an accumulation of characteristics over time.

Animal breeding, genetics, and genomics is the branch of science concerned with maximizing desirable genetic traits, such as producing animals that have leaner meat. Animal geneticists have identified elements within genes that can enhance animal growth, health, and ability to utilize nutrients. These genetic advances can increase production while reducing environmental impacts.

This antique book comprises a comprehensive treatise on the breeding of livestock, with information on heredity, reproduction, selection, and many other important aspects of animal breeding. This text covers a variety of different animals commonly kept on a farm, including sheep, horses, cattle, swine and more. Written in clear, concise language and complete with handy tips, detailed illustrations, helpful tables, and much more besides, this is a text that will be of much appeal to farmers and anyone else interested in the breeding of livestock. The chapters of this book include: 'The Arabian Horse', 'French Horse-Breeding', 'The Thoroughbred', 'British Stock', 'Robert Bakewell', 'Influence of Bakewell's Work', 'Dates of Founding of the Breeds', 'European Stocks in America', 'The American Trotter', 'Draft Horses from Europe', 'Coach Horses', etcetera. We are proud to be republishing this volume now complete with a new introduction on farming.

First published in 1943, "Animal Breeding Plans" contains a detailed guide on animal breeding designed for students with experience of genetics, embryology, breeds, and stock judging. It aims to furnish the reader with a clear understanding of the means available for improving the heredity of farm animals, especially what each possible method will or will not do well. Highly recommended for modern farmers and animal breeders. Contents include: "Origin and Domestication of Farm Animals", "Consequences of Domestication", "Beginning of Pedigree Breeding Methods in the United States", "History of Animal Breeding Methods in the United States", "Relation of the Breed Association to Breed Improvement", "Genetic Principles in Animal Breeding", "Mendelian Basis of Inheritance", etc. Many vintage books such as this are increasingly scarce and expensive. It is with this in mind that we are republishing this volume now in an affordable, modern, high-quality edition complete with a specially-commissioned new introduction on farming.

Before crude oil and the combustion engine, the industrialized world relied on a different kind of power - the power of the horse. Horses in Society is the story of horse production in the United States, Britain, and Canada at the height of the species' usefulness, the late nineteenth and early twentieth-century. Margaret E. Derry shows how horse breeding practices used during this period to heighten the value of the animals in the marketplace incorporated a intriguing cross section of influences, including Mendelism, eugenics, and Darwinism. Derry elucidates the increasingly complex horse world by looking at the international trade in army horses, the regulations put in place by different countries to enforce better horse breeding, and general aspects of the dynamics of the horse market. Because it is a story of how certain groups attempted to control the market for horses, by protecting their breeding activities or 'patenting' their work, Horses in Society provides valuable background information to the rapidly developing present-day problem of biological ownership. Derry's fascinating study is also a story of the evolution of animal medicine and humanitarian movements, and of international relations, particularly between Canada and the United States.

Canadian historian Margaret Derry examines the evolution of modern animal breeding from the invention of improved breeding methods in 18th-century England to the application of molecular genetics in the 1980s and 1990s.

The determination of when, how, how often and with whom an animal breeds is moving rapidly away from evolutionary pressures and towards human purposes: these include the breeding of around 50 billion mammals and birds for food production annually, the breeding of pedigree dogs and cats, racing dogs and horses, specialised laboratory animal strains and the use of reproductive science to conserve endangered species or breeds and to limit unwanted populations of pests and non-native species. But the ethics and sustainability of this takeover of animals' reproductive lives have been insufficiently examined by either professionals or the public. This book discusses the methods, the motivations and the consequences of human intervention in animal breeding in terms of animal health, behaviour and well-being. It explores where we are now and the choices ahead, and looks to a future where we have more respect for animals as sentient beings and where we could loosen the reins of reproductive control.
