of an expansive selection of topics in human evolution, variation and adaptability for professionals and students in biological anthropology, evolutionary biology, medical sciences and psychology. The chapters are organized around four broad themes, with sections devoted to phenotypic and genetic variation within and between human populations, reproductive physiology and behavior, growth and development, and human health from evolutionary and ecological perspectives. An introductory section provides readers with the historical, theoretical and methodological foundations needed to understand the more complex ideas presented later. Two hundred discussion questions provide starting points for class debate and assignments to test student understanding.

Instructors consistently ask for a human biology textbook that helps students develop an understanding of the main themes of biology while placing the material in the context of the human body. Mader's Human Biology was developed to fill this void. To accomplish the goal of improving scientific literacy, while establishing a foundation of knowledge in human biology and physiology, Human Biology integrates a tested, traditional learning system with modern digital and pedagogical approaches designed to stimulate and engage today ' s student. Multimedia Integration: Michael Windelspecht represents the new generation of digital authors. Through the integration of multimedia resources, such as videos, animations and MP3 files, and in the design of a new series of guided tutorials, Dr Windelspecht has worked to bring Dr. Mader ' s texts to the new generation of digital learners. carried out in both polar regions. The first portion of the compilation describes the problems encountered by Antarctic expeditions in the 1930s and today, which illustrates the tremendous changes in the way in which Antarctic expeditions operated then and now. Following the review papers, medical and dental aspects are also described, including a brief discussion on microbiology. The final section of this book deals with psychological and behavioral aspects, indicating that the interpretation of physiological studies of the effects of cold on man would be greatly helped by knowledge of the psychological effects of the polar situation. This text is a good reference for students or individuals conducting research on human and marine biology in the Antarctic regions.

Intended for non-majors, this textbook describes the structure and functions of each human body system, explores the body processes that regulate chemical levels in the blood and body temperature, and overviews genetics, human reproduction, and evolution.
