The outline below describes engine installation steps common to most of our displacement power boats. The pictures show our TW28. The stringers and bulkheads may look slightly different but the procedure is always the same. The steps are as follow: 1.Build the engine girders 2.Locate the axis of the prop shaft 3.Drill through skeg (keel) 4.Install stuffing box frame 5.Build and install stern tube (shaft tube) 6.Install and align engine The stringers are used as engine bed (girders).

The length of the engine beds is shown on the plans. Cut the layers of wood to fit the stringers and the bottom of the hull. Epoxy glue your engine bed layers together but do not bond them to the stringers. Install the engine beds in the hull, clamp them against the stringers and drop the engine template on the beds.

Water-cooled exhaust manifolds are used with many inboard engines. A heat exchanger may be used to raise the temperature of the incoming water. The water-cooled manifolds also help prevent heat buildup in boats where the engines are in a covered compartment. The constant load on a marine engine means it runs hot, even with lots of cooling.

In the old days, many marine engine cooling systems were of the "raw-water" variety, meaning simply that they relied on pumping whatever water the boat was floating in through the engine and pumping it out the exhaust system-salt water, polluted water, algae-infested water, whatever was available.

[Inboard Engine Cooling Systems - boats.com](#)

Electric boat drives are gaining ground - even on water. However, many systems currently offered on the market are custom-built by small vendors without an overarching, standards-compliant safety concept. The result is a high number of dangerous accidents on and damage to boats fitted with these customized solutions.
