This textbook covers all the standard introductory topics in classical mechanics, including Newton's laws, oscillations, energy, momentum, angular momentum, planetary motion, and special relativity. It also explores more advanced topics, such as normal modes, the Lagrangian method, gyroscopic motion, fictitious forces, 4-vectors, and general relativity.

Introduction to Classical Mechanics: With Problems and ...

Since the bottom angle of the isosceles triangle is 2θ , the top side has length $2L \sin \theta$, and the altitude to this side is $L \cos \theta$. So the area of the triangle is $L^2 \sin \theta \cos \theta$. The mass is therefore $\rho L^2 \sin \theta \cos \theta$. Equating the weight with the upward component of the normal forces gives $N = (\rho g L^2 / 2) \cos \theta$.

Introduction to Classical Mechanics

"This textbook serves as an introduction to standard undergraduate classical mechanics topics, including Newton's laws, energy, momentum, oscillators, rotational dynamics and angular momentum. ... The real value of this book, however, lies in the extensive set of problems and worked solutions that many students tend to crave and as such is sure to be warmly welcomed."

the position along the plane is $p = v_0 t - \frac{1}{2} (g \sin \theta) t^2$. Setting this equal to L gives $t = (v_0 \pm \sqrt{v_0^2 - 2gL \sin \theta}) / g \sin \theta$. The speed at the top of the plane is then $V = v_0 - (g \sin \theta) t = \sqrt{v_0^2 - 2gL \sin \theta}$.
