The book "Introductory Microbiology" consists of nine chapters covering all the basics required for the beginners in microbiology. The first chapter "Introduction to Microbiology" gives a brief insight of the historical development of microbiology, pioneers in microbiology, developments and various branches of microbiology, and scope of microbiology. As microorganisms are ubiquitous in distribution, a need for the study of microbial techniques for the proper identification of microorganisms to scientists involved in applied research and industry for their exploitation. The author describes the various isolation and enumeration techniques of microorganisms in the second chapter "Isolation and Enumeration of Microorganisms". The author describes the stains, its types, and various staining methods in the third chapter

“Staining Techniques” for the easy identification of various bacteria as they are quite colourless, transparent, and have a refractive index of the aqueous fluids wherein they’re suspended. Microorganisms are too small (nanometers to micrometers) to be seen by our unaided eyes and therefore the microscopes are of crucial importance to view the microbes. Hence the author in the fourth chapter “Microscopy” have described the metric units, properties of light, basic quality parameters of microscopic image, the components of various light and electron microscopes with reference to their working principles, and limitations. The newer techniques in microscopy such as confocal, fluorescence, confocal, scanning probe, and atomic force microscope and application have also been described. Microbial cells are structurally complex, perform numerous functions, and have a need for carbon, energy, and electrons to construct new cellular components and do cellular work. Hence microorganisms should have a constant supply of nutrients, and a source of energy, which are ultimately derived from the organism’s environment. The author in this fifth chapter “Microbial Nutrition” describes the basic common nutrients required for the microbial growth, nutritional types of microorganisms, nutritional and physical requirements of microbial growth, and the various nutrient uptake mechanisms with a special emphasis on the passive and active transport, group translocation, and Iron uptake. Culture is an in vitro technique of growing or cultivating microorganisms or only other cells in a suitable nutrients medium called a culture medium in the laboratory. A culture medium is a solid or liquid preparation used to grow, transport, and store microorganisms. Different microorganisms require different nutrient materials. All the microbiological studies depend on the ability to grow and maintain microorganisms in the laboratory which is possible only if suitable culture media are available. The author in the sixth chapter “Culture media and methods” have described the historical prospective of the culture medium, important factors for cultivation, common ingredients of a culture medium, classification of culture media based on consistency, nutritional component, and functional use, special culture techniques, and some of the commonly used laboratory media have been briefly described. People have been practicing disinfection and sterilization unknowingly since time immemorial, though the existence of microorganisms was unknown. The complete destruction or removal of all living microorganisms or their spores by any physical, chemical, or mechanical means is called sterilization. Sterilization can be accomplished by using heat, filtration, and gases. A satisfactory sterilization process is designed to ensure a high probability of achieving sterility. This author in the seventh chapter “Sterilization” have described the basic principles of sterilization, factors influencing the effectiveness of antimicrobial agents, various physical and chemical agents and other agents of sterilization. The strain development is a primary step, in the process of fermentation or growth studies carried out in any fermentation process or microbiological research, which enables to increase the population of microorganisms from stock culture, to obtain cells in an active, and exponential growth phase. The author in the eighth chapter “Strain development and improvement” have described the historical prospective of fermentation with reference to brewing, and bakers yeast, development of inoculum for bacteria, and fungi. He has described the conventional (Metagenomics, genetic engineering, and mutation selection), and latest strain improvement methods such as the genomic, transcriptome, proteomic, and metabolome analysis. Microbial culture preservation aims at maintaining a microbial strain alive, uncontaminated, without variation or mutation. The author in the ninth chapter “Culture Preservation” describes the relevance of various culture preservation techniques with the objective of maintaining live strains, uncontaminated, and to prevent change in their characteristics.

livelihood. In today's modern world a large chunk of people's life is spent at work. People spend around one third of their life at their work place. This enormous part of life time spent at work should give satisfaction and a sense of fulfillment for having worked purposefully, constructively, and fruitfully. Working is a critical activity for the preservation of personal health and is important for human beings. It also serves as an energizer for personal identity and boosts the self-esteem of men and women as they take up meaningful work. It also develops a sense of identity, dignity, and worth. Achievement of a meaningful result assists an individual in growing and actualizing his full potential. It improves the conditions of life of a community. While working, an individual is exerting an effort in order to make something, to achieve something, or to produce a desired effect. For human beings, "to be able to do something" means to make it visible that "I", as the subject, is active in the world, that "I" exist. Working is a meaningful way to prove one's existence, and hopefully, that it is worth to be lived.

This book presents the outcomes of the 2017 national workshop and international conference organized by CEENR of ISEC, Bengaluru and Assam University Silchar. Addressing the threats to biodiversity and sustainable development resulting from the impacts of human induced pressures on ecosystems and global-warming-driven climate change is a major challenge. It requires increased knowledge and an enhanced information base in order to devise local policies to improve the adaptive capacity of vulnerable socio-ecological systems in developing countries. In this context, the book presents research that has the potential to benefit the environment and empower communities. It appeals to researchers investigating diverse aspects of socio-ecological-biological systems to create strategies for resource use, conservation and management to ensure sustainability.

This new volume highlights the evolution of digital education related issues by reporting on effective IoT-based technologies for the teaching-learning process. It brings together a selection of leading academic policymakers, researchers, educationalists, and education scholars to share their experiences and research on many aspects of digital pedagogy in the Education of Things. The volume discusses recent innovations, trends, and concerns as well as the practical challenges encountered and solutions adopted in the fields of digital pedagogies and educational design. The chapters cover the concepts of IoT-based digital technologies regarding teacher and teaching education, IoT-based education, flipped learning, assessment process, and more. Key features: Introduces the integration of technology with digital education Explains the functional framework workflow in the Education of Things and networked learning Explores basic and high-level concepts of teaching-learning pedagogy in IoT-based education Covers the major challenges, issues, and advances in flipped and blended learning based on IoT technologies Looks at digital education pedagogy collaborations with organizations outside academia Explores teaching education and the process of assessment, testing, and evaluation Digital Education for the 21st Century: Technologies and Protocols provides a rich resource for academic and administrative policymakers, academicians, researchers, educationalists and experts who are concerned with educational research.
