Analytic projective geometry uses linear algebra. For instance, for three points of the projective plane t, u, v $\{\displaystyle$

$\{t, u, v\}$, setting up the equations for those points by fixing vectors representing each, shows that the three are collinear — incident in a single line — if and only if the resulting three-equation system has infinitely many row vector solutions representing that line.

In mathematics, projective geometry is the study of geometric properties that are

invariant with respect to projective transformations. This means that, compared to elementary Euclidean geometry, projective geometry has a different setting, projective space, and a selective set of basic geometric concepts. The basic intuitions are that projective space has more points than Euclidean

linear group (also known as the projective general linear group or PGL) is the induced action of the general linear group of a vector space V on the associated projective space $P(V)$. Explicitly, the projective linear group is the quotient group. $PGL(V) = GL(V)/Z(V)$
