The paper discusses the design of a racing motorcycle engine to compete in World Superbike racing. This class of motorcycle racing is based on production machines with four-stroke engines only. The rules allow three engine variants to be used, a 750 cm³ four-cylinder engine, a 1000 cm³ twin-cylinder engine, and a 900 cm³ three-cylinder engine. To date only the first two variations have been employed but this paper shows that the 900 cm³ engine has the highest potential power output of ...

A motorcycle engine is an engine that powers a motorcycle. Motorcycle engines are typically two-stroke or four-stroke internal combustion engines, but other engine types, such as Wankels and electric motors, have been used. Although some mopeds, such as the VéloSoleX, had friction drive to the front tire, a motorcycle engine normally drives the rear wheel, power being sent to the driven wheel by belt, chain or shaft. Historically, some 2,000 units of the Megola were produced between 1921 ...

We race mainly in two engine classes "V" vintage, "P" pushrod and in two body/frame classes "A" Special Construction, "M" Modified Production. Both vintage and pushrod engines are based on 650cc pre-unit Triumph engine & gearbox combinations. The main difference is that we are allowed to use aftermarket crankcases in the pushrod classes. The 650cc "Pushrod Fuel" Triumph engine specs:

Motorcycle braking systems have varied throughout time, as motorcycles evolved from bicycles with an engine attached, to the 220 mph (350 km/h) prototype motorcycles seen racing in MotoGP. Most systems work by converting kinetic energy into thermal energy (heat) by friction. On motorcycles, approximately 70% of the braking effort is performed by the front brake.

Compared to the reciprocating piston engine, the Wankel engine has more uniform torque and less vibration and, for a given power, is more compact and weighs less. The rotor, which creates the turning motion, is similar in shape to a Reuleaux triangle, except the sides have less curvature. Wankel engines deliver three power pulses per revolution of the rotor using the Otto cycle. However, the output shaft uses toothed gearing to turn three times faster giving one power pulse per revolution. This
