Fatty liver disease is the most common type of liver disease seen in the world today. Some people with fatty liver disease simply have excess fat in the liver. Although not normal, it's not serious if it doesn't lead to inflammation or damage. However, once there's a build-up of fat, the liver becomes vulnerable to injury. Others have what's called non-alcoholic steatohepatitis (NASH). NASH can lead to permanent liver damage and cirrhosis. Both types of non-alcoholic fatty liver disease (NAFLD) are becoming more common. Up to 20% of adults have either fatty liver or NASH. The most common causes of fatty liver disease are obesity and diabetes mellitus. Written by experts and based on the most current information available, this indispensable guide is for anyone living with fatty liver disease. And diet plays a major role in managing the condition, so 100 specially selected recipes are also included.

Autophagy in *Current Trends in Cellular Physiology and Pathology* is addressed to one of the fundamental molecular mechanisms - autophagy - evolutionarily adopted by cells for processing of unnecessary or malfunctioned constituents and shaping intracellular structures, adjusting them to environmental conditions, aging, disease, neoplasia, and damages over their life period. Particular attention is paid to autophagy-mediated barrier processes of selective sequestration and recycling of impaired organelles and degradation of invading microorganisms, that is, the processes sustaining intrinsic resistance to stress, tissue degeneration, toxic exposures, and infections. The presented topics encompass personal experience and visions of the chapter contributors and the editors; the book chapters include a broad analysis of literature on biology of autophagy.
