With increased awareness about pharmacogenomics-based testing, patients may provide genetic information to their physicians to help inform drug product selection. In particular, direct-to-consumer companies have emerged that provide genotyping services for disease-risk and drug-response genes (34, 35). The information provided by these companies may allow consumers to require more personalized medical treatments from their physicians.

## ~~Pharmacogenomics Applications To Patient Care~~

Pharmacogenomics is the study of how a patient's genome can influence how they respond to medicines. Variants in an individual's genome can increase the functioning of medicines or make them ineffective. They can also help predict which patients will suffer from side-effects - from the merely unpleasant to potentially life-threatening.

This report reviews a variety of patient care situations in which evidence is emerging to show patient benefit from pharmacogenomic (PGx) testing. Recent Findings Preemptive PGx testing minimizes delays in treatment, reducing costs and time to therapeutic effect; however, preemptive testing is currently not feasible in all healthcare settings.

Abstract. The clinical implementation of pharmacogenomics is becoming more common, in part due to the availability of clinical guidelines that describe how to use pharmacogenetics test results to optimize medication therapy. In this chapter, we discuss the Clinical Pharmacogenetics Implementation Consortium and Dutch Pharmacogenetics Working Group guidelines, including the writing process, components and recommendations, the application of the guidelines to clinical practice, and guideline ...
