This book offers a broad range of general and fundamental methods that are commonly used by plant biochemists, physiologists, and molecular biologists. It covers the key techniques for plant bioenergetics as well as those fundamental to plant productivity and biomass, making this an invaluable resource for scientists working on any of the multiple aspects of photosynthesis.

This pioneering text provides a holistic approach to decisionmaking in transportation project development and programming, which can help transportation professionals to optimize their investment choices. The authors present a proven set of methodologies for evaluating transportation projects that ensures that all costs and impacts are taken into consideration. The text's logical organization gets readers started with a solid foundation in basic principles and then progressively builds on that foundation. Topics covered include: Developing performance measures for evaluation, estimating travel demand, and costing transportation projects Performing an economic efficiency evaluation that accounts for such factors as travel time, safety, and vehicle operating costs Evaluating a project's impact on economic development and land use as well as its impact on society and culture Assessing a project's environmental impact, including air quality, noise, ecology, water resources, and aesthetics Evaluating alternative projects on the basis of multiple performance criteria Programming transportation investments so that resources can be optimally allocated to meet facility-specific and system-wide goals Each chapter begins with basic definitions and concepts followed by a methodology for impact assessment. Relevant legislation is discussed and available software for performing evaluations is presented. At the end of each chapter, readers are provided resources for detailed investigation of particular topics. These include Internet sites and publications of international and domestic agencies and research institutions. The authors also provide a companion Web site that offers updates, data for analysis, and case histories of project evaluation and decisionmaking. Given that billions of dollars are spent each year on transportation systems in the United States alone, and that there is a need for thorough and rational evaluation and decision making for cost-effective system preservation and improvement, this text should be on the desks of all transportation planners, engineers, and educators. With exercises in every chapter, this text is an ideal coursebook for the subject of transportation systems analysis and evaluation.

The history of documentary has been one of adaptation and change, as documentarists have harnessed the affordances of emerging technology. In the last decade interactive documentaries (i-docs) have become established as a new field of practice within non-fiction storytelling. Their various incarnations are now a focus at leading film festivals (IDFA DocLab, Tribeca Storyscapes, Sheffield DocFest), major international awards have been won, and they are increasingly the subject of academic study. This anthology looks at the creative practices, purposes and ethics that lie behind these emergent forms. Expert contributions, case studies and interviews with major figures in the field address the production processes that lie behind interactive documentary, as well as the political, cultural and geographic contexts in which they are emerging and the media ecology that supports them. Taking a broad view of interactive documentary as any work which engages with 'the real' by employing digital interactive technology, this volume addresses a range of platforms and environments, from web-docs and virtual reality to mobile media and live performance. It thus explores the challenges that face interactive documentary practitioners and scholars, and proposes new ways of producing and engaging with interactive factual content.

performativity through the body. Exploring the notion of the body as central to creative practice it draws together conversations centring on innovation through embodied knowledge relating to space, time and place. The authors in this collection are leaders in their field and recognized internationally. Their chapters represent new directions in thought and practice by game-changers in the arts. Underpinned by a central theme of corporeality, it is bold and innovative in its scope and range, bringing diverse disciplines together. It enables connections that create new ways of critically exploring corporeality extending beyond physicality and the traditional body-centred areas of performing arts practice. Insightful and stimulating reading for students, scholars and practitioners across the tertiary arts sector, as well as education, therapy, cultural studies and interdisciplinary arts.

This handbook is an authoritative, comprehensive reference on optical networks, the backbone of today's communication and information society. The book reviews the many underlying technologies that enable the global optical communications infrastructure, but also explains current research trends targeted towards continued capacity scaling and enhanced networking flexibility in support of an unabated traffic growth fueled by ever-emerging new applications. The book is divided into four parts: Optical Subsystems for Transmission and Switching, Core Networks, Datacenter and Super-Computer Networking, and Optical Access and Wireless Networks. Each chapter is written by world-renown experts that represent academia, industry, and international government and regulatory agencies. Every chapter provides a complete picture of its field, from entry-level information to a snapshot of the respective state-of-the-art technologies to emerging research trends, providing something useful for the novice who wants to get familiar with the field to the expert who wants to get a concise view of future trends.
