In this book, Dr Mak views the financial market from a scientific perspective. The book attempts to provide a realistic description of what the market is, and how future research should be developed. The market is a complex phenomenon, and can be forecasted only with errors — if that particular market can be forecasted at all. The book reviews the scientific literatures on the financial market and describes mathematical procedures which demonstrate that some markets are non-random. How the markets are modeled — phenomenologically and from first principle — is explained. It discusses indicators, which are quite objective, rather than price patterns, which are rather subjective. Similarities between indicators in market trading and operators in mathematics are noted, and particularly, between oscillator indicators and derivatives in Calculus. It illustrates why some indicators, e.g., Stochastics, have limited usage. Several new indicators are designed and tested on theoretical waveforms to check their validity and applicability. The indicators have a minimal time lag, which is significant for trading purposes. Common market behaviors like divergences between price and momentum are explained. A skipped convolution technique is introduced to allow traders to pick up market movements at an earlier time. The market is treated as a nonlinear phenomenon.

Forecasting of when the market is going to turn is emphasized. Contents: Is the Market Random? Models of the Financial Markets Signals and Indicators Trending Indicators Oscillator Indicators Vertex Indicators Various Timeframes Wavelet Analysis Other New Techniques Trading Systems Financial Markets are Complex Readership: Investors, traders and undergraduate students of finance.

Since the 2008 financial crisis, a resurgence of interest in economic and financial history has occurred among investment professionals. This book discusses some of the lessons drawn from the past that may help practitioners when thinking about their portfolios. The book's editors, David Chambers and Elroy Dimson, are the academic leaders of the Newton Centre for Endowment Asset Management at the University of Cambridge in the United Kingdom.

In the current era of globalised financial markets, the stock market cannot be assessed solely by comparing quantitative features such as the number of listed companies or capitalisation on the stock exchange. This is of secondary importance from an investor's point of view. What is important, however, is how a given stock market behaves towards the environment – whether it is ' hyperactive ' or ' excessively lethargic ' in response to information. This book provides an innovative tool for assessing global stock markets. It describes the complex concept of ' stock market development ' in light of classical and behavioural finance theories and considers both quantitative (the number of listed companies, turnover, etc.) and behavioural aspects (price volatility, the behaviour of fundamental indicators of listed companies). Based on an innovative method for assessing development, the author analyses 130 stock markets, indicating those that are more developed in terms of quantity and behaviour. Ultimately, this enables the assessment of which markets are more or less developed

and why. This knowledge, used properly, offers an advantage over other financial market participants, and allows for the comprehensive assessment of individual stock markets, which can support the process of making good investment decisions. The book is an invaluable resource for research fellows and students in economics, particularly the field of finance. It is also addressed to business and stock market practitioners, such as financial market analysts, brokers and investment advisers.
