Having been in service since 2006, the SOAP API is our legacy interface. Full support is still offered for V7, but where possible, developers of new integrations are strongly encouraged to consume the newer REST API, which offers the vast majority of the functionality present in the SOAP API plus much more. The REST API includes the SOAP API Credentials Flow to help SOAP API users transition to REST as seamlessly as possible.

The API also uses several error handling objects. If an error occurs during a SOAP request,

the API returns a SOAP fault message. The message contains different content, depending on the type of error: If an error affects the entire request, an API Fault Element, is returned, containing an ExceptionCode and the associated error message text.

SOAP API Developer's Guide Structure of an XML file An XML file is just a structured text file.
The best way to understand XML is to look at example files.

SOAP API Developer's Guide - Structure of an XML file
In the world of SOAP, the client is a computer program that asks a server (another computer
program) to execute a method (sometimes called a web service). In CIC configuration, HTTP
requests are received by SOAP Listener— an ISAPI DLL that runs on an IIS web server. SOAP
Listener passes requests to the CIC Notifier subsystem for processing.
