Soil Testing. Brief soils testing and reporting as required by councils for subdivision approval; confirming that a lot is suitable for construction. Site specific reports to confirm whether a proposed building platform is " good ground " as defined in NZS3604 and appropriate for construction in accordance with this code. Where the soils do not meet these standards, the information gathered may be used by DB Consulting Engineers or others to design specific foundations or ground improvement.

Determine necessary soil parameters through field and lab testing (e.g., consolidation test, triaxial shear test, vane shear test, standard penetration test). Design the foundation in the safest and most economical manner. The primary considerations for foundation support are bearing capacity, settlement, and ground movement beneath the foundations. Bearing capacity is the ability of the site soils to support the loads imposed by buildings or structures.

The information in a soil test is used by a structural engineer to design the footings or foundations for your new house or house extension. Structural engineers need to know if there are any problems with the soil on your block so that they can design your house footings correctly for those site conditions. The main soil problems are:

Specific gravity test; Atterberg limits and indices; Grain size analysis; Compaction test; Permeability test; Capillary head test; Capillarity-permeability test; Consolidation test; Direct shear test on cohesionless soil; Triaxial compression test on cohesionless soil; Triaxial compression test on cohesionless soil; Unconfined compression test; Triaxial compression test on cohesive soil; Direct shear test on cohesive soil.
