Electrical impedance spectroscopy, in AC and DC current modes at various temperatures, was used to study the conduction properties of the CWO monoclinic structure. Because of the similar structural and microstructural characteristics of both CWO 600 °C and CWO 1000 °C, we only report results obtained from the latter sample.

The electrical resistivity decreases with increasing pressure and exhibits an order of magnitude drop at about 25 GPa. GeTe transforms from the rhombohedral to the NaCl-type structure at 3 GPa and, at 18 GPa, transforms into a possibly orthorhombic structure with a space group Pbcn, accompanied by a remarkable rise in electrical resistivity.
