Seismic design is required for all SC-I SSCs and for II/I sources of interaction. This is typically most SSCs inside the reactor building and SSCs in many parts of the auxiliary, and a few systems in the turbine buildings. More than any other industry, seismic design permeates much of the design of a nuclear power plant.

Various design codes, standards and guidelines for fire or seismic design of structures have been developed in different countries around the world to ensure the safety of occupants in buildings in the event of a fire or an earthquake. Seismic design codes provide tools for design and recommendations for analysis of structures against earthquake, while fire design codes provide requirements for the fire protection and fire resistance of building elements to reduce the risk of structural ...

seismic design shear forces. Seismic design shear V_e in plastic hinge regions is associated with maximum inelastic moments that can develop at the ends of members when the longitudinal tension reinforcement is in the strain hardening range (assumed to develop 1.25 f_y). This moment level is labeled as probable flexural strength, M_{pr} . Figure 6-1 ...

Hromis, I'm not sure if you've performed a strut-and-tie model before, but it's pretty intuitive and can be used to solve the foundation whether it's seismic/wind/gravity controlled. I wouldn't worry too much about ACI 318 chapter 21 as it is more geared towards seismic DETAILING than design.

Aims of Earthquake Engineering. Earthquake engineering is the science of the performance of buildings and structures when subjected to seismic loading. It also assists analysing the interaction between civil infrastructure and the ground, including the consequences of earthquakes on structures. One of the most important aims of earthquake engineering is the proper design and construction of buildings in accordance with building codes, so as to minimize damage due to earthquakes.
