A rule-based system is a system that applies human-made rules to store, sort and manipulate data. In doing so, it mimics human intelligence. To work, rule-based systems require a set of facts or source of data, and a set of rules for manipulating that data.

What first comes to my mind is the Gof' Design Pattern called Strategy. You encode your rules in the Concrete Strategy objects. So you could have a particular Concrete Strategy object that is changing in time. But best is to change of Concrete Strategy objects to reflect the new rule, IMHO. The wikipedia link has an example in C++.

Creating motion using the rule of thirds. Asymmetry in design is a good thing, but when your design focuses more on one side of the canvas and neglects the other, it can create a sense of motion in your design. This can be either beneficial or harmful to your design, depending on what message you ' re trying to convey.

How to Use the Rule of Thirds Effectively in Graphic Design

For a large enterprise app, everyone knows that being able to adjust to change is one of the most important aspects of design. I use a rule-based approach a lot of the time to deal with changing business logic, with each rule being stored in a DB. This allows for easy changes to be made without diving into nasty details.

The most commonly employed rule-based design is the 3 + 3 design. It sequentially enrolls cohorts of three patients; the first cohort is treated at a starting dose that is considered to be safe based on extrapolation from animal toxicological data or prior experience in other disease conditions, and the subsequent cohorts are treated at increasing dose levels that have been fixed in advance.

Introduction to Rule-based Applications

In computer science, a rule-based system is used to store and manipulate knowledge to interpret information in a useful way. It is often used in artificial intelligence applications and research. Normally, the term rule-based system is applied to systems involving human-crafted or curated rule sets. Rule-based systems constructed using automatic rule inference, such as rule-based machine learning, are normally excluded from this system type.

Rule-based programming paradigm emerged at that time as ways to implement systems that appear to think and reason like human beings. Examples of rule-based systems are expert systems that have the knowledge of a doctor or a tax advisor and can answer complex questions people would normally ask those professionals. The idea of rule-based programming is to represent a domain expert ' s knowledge in a form called rules.
