Zone Electrophoresis 27 28. Capillary Gel Electrophoresis 28 It is generally performed in porous gel formed by a polymer matrix. The polymer used is normally Polyacrylamide (monomer Acrylamide $\text{CH}_2=\text{CH}-\text{CO}-\text{NH}_2$) The gel used adds an additional component of sieving (size) into the separation process.

Routine electrophoresis is a generic term for the traditional clinical laboratory electrophoresis performed on a rectangle-shaped slab gel.

Routine electrophoresis is mostly used for separation of proteins and has some use in separating nucleic acids.

This type of electrophoresis is sometimes called zone

Zone electrophoresis (ZE) is the most widely used mode. It is fundamentally the simplest form of CE, mainly because the capillary is only filled with buffer. Separation occurs because solutes migrate in discrete zones and at different velocities and are separated solely based on differences in μ_{ep} .

Capillary zone electrophoresis – Of all capillary electrophoresis methods, the capillary zone is the most common. It is also known by the name free solution capillary electrophoresis. In this type of separation method, the ratio of charge particles to mass is taken into consideration.

Capillary Electrophoresis - Applications and Procedure ...

B. Zone Electrophoresis: This is the most prevalent electrophoretic technique of these days. In this type of electrophoresis the separation process is carried out on a stabilizing media as discussed above. The zone electrophoresis is of following types; (a) Paper electrophoresis (b) Cellulose acetate electrophoresis (c) Capillary ...

Electrophoresis terminology There are a few significant differences between the nomenclature of chromatography and capillary electrophoresis. For example, a fundamental term in chromatography is retention time. In electrophoresis, under ideal conditions, nothing is retained, so the analogous term becomes migration time.

Zone electrophoresis techniques were then introduced, where filter paper, capillary tubes were used as carrier matrix for the movement of molecules. 1955: In this year, Oliver Smithies introduced agarose gel and polyacrylamide gels as a substrate for the separation of biomolecules.

Following electrophoresis, the separated antigens are reacted with specific antisera placed in troughs parallel to the electrophoretic migration and diffusion is allowed to occur. Antiserum present in the trough moves toward the antigen components resulting in the formation of separate precipitin lines in 18-24 hrs, each indicating reaction between individual proteins with its antibody.
